

Hip Preservation

Overview:

Hip Preservation is a rapidly expanding field that includes surgery for patients that are not in need of a hip replacement. The goal is to improve the pain and function of the hip and hopefully delay or prevent the need for hip replacement. The following are some of the conditions treated and services offered:

Conditions:

Labral tear
Femoroacetabular impingement
Hip Dysplasia
SCFE
Perthes disease
Hamstring tears
Gluteus medius/minimus tears

Treatments:

Hip Arthroscopy
Labral repair/reconstruction
Surgical hip dislocation
Periacetabular osteotomy (PAO)
Tendon repairs/reconstruction

Call our office today to schedule an appointment to see if you are a candidate for these types of procedures.
